List Plan Groups (GET /v3/plangroups)

The list plan groups api will leverage core proxy's existing /applicationstartup api to retrieve a list of all available "portalGroups" and cache them in Redis unfiltered. If the request contains filter params the service will filter the results in the cache accordingly and respond with the filtered plan groups or an empty array. The Redis cache will cache the results for 30 minutes initially but this will be an environment variable and can change. For more information see [F83368: Enabler \(Arch\): AWS Login Event](#)
