Goal

The goal of this activity is to identify the Domains and the Capabilities they are associated with , in Pharmacy. *This is a work in progress.*

Current State Models

ICE

CareMark

CVSRetail

Specialty

Terminology - Ubiquitous Language (UL)

Terminology - Ubiquitous Language (UL)

Profile= Logon Account

CAGM - It is important to understand each term of the client hierarchy as they impact the clients plan design, member eligibility and benefit set up within RxClaim

Carrier: Identifies the highest level of the hierarchy (usually client name). All Accounts and Groups have a direct relationship with the Carrier. Carrier refers to the entire book of business. This is where the billing and invoicing is established.

Account: Second level of hierarchy. Identifies divisions for the client such as locations, lines of business, etc. There can be an unlimited number of Accounts.

Group: The third level of the hierarchy. The Group level normally designates the collective group of plan members that have the same benefit design and/or segregated for reporting purposes.

Member: Located within the Groups. Each plan insured plan member, which would include the cardholder, spouse or dependents has a unique record (identification number) within RxClaim.

Plan/Benefits: A benefit plan is an outline of covered items, excluded items, dispensing limitations and payment guidelines. The Client's benefit plans are linked to either the Group or Member ID.

EOB - This domain provides: the claim details; adjudication details from the processing of a Claim; and optionally account balance information, for informing the subscriber of the benefits provided

Document - A coherent set of information that is a statement of healthcare information, including clinical observations and services. A document is an immutable set of resources with a fixed presentation that is authored and/or attested by humans, organizations and devices. Documents built in this fashion may be exchanged between systems and persisted in document storage and management systems.

Contract - Legally enforceable, formally recorded unilateral or bilateral directive i.e., a policy or agreement.

Consumer = A customer who buys medicines
Client = A company which manufactures a medicine/resells their medicine
Pharmacy = The place where drug is stored and sold
Prescriptions= a List of Medication prescribed by a Licensed doctor/pharmacist (has quantity, has refill allotment)
Drug = Medicine
Benefits=Plan
Provider = Healthcare provider
Anti Corruption Layer = a Layer which is created to keep two domains pure. Used in cases where a capability does not belong to a domain or only partially belongs to a domain. The idea is to keep ACL as a "Big Ball of Mud" till it reaches purity to become a domain itself someday.
DataMesh= Treating Data as a Product. A Domain which contains a centralized repository of data and its associated capabilities like AI and ML

Best Practice:
High Cohesion - Entities inside a Domain can have High Cohesion (Tight Coupling). Domain Model (The way a domain manages Data) lies in the heart of domain which make a Domain act as a System of Record. Thinking of a Domain like a Onion, data is the central part of the onion with all the layers (API, Services etc.) as Onion layers.
High Cohesion Principle of data ensure that the data is not "sprinkled" outside of domain and every domain acts as System of Record.
Loose Coupling - A Domain should be as complete as possible in terms of Boundary(Bounded Context) and should be Loosely coupled with other Domains

Key Timelines and Milestones

Year	Milestone
2024	 Big Picture Architectural North Star was published providing guidance on Experiences , Capabilities and Domains
2023	i90 Framework implements Digital APIs as Experience APIs, Capability APIs and Domain APIs in alignment with the Digital pharmacy's Domain Architecture
2022	Digital Pharmacy Domain Architecture was created showing Personas, Capabilities and Domain using the below industry models: 1. FHIR 2. FHIM 3. OMOP's CDM (Common Data Model)
